197.0. Road off to Yackandandah on left.

204.3. Start of Wodonga center by-pass.

[Pasture & roadsides were mainly very dry & the latter dominated by *Phalaris* and/or *Paspalum*. Almost throughout, the roadsides had been mown to c 6-9 in high & the regrowth was green, but had been preceded by a tall dense growth not well suited to *Proscibulus*.

Praxibulus was largely confined to depressed areas where there was still some green, but where clumps of native grasses were present adjacent to mown grasses. Whether this is a result of the very dry general conditions, or is a permanent feature of the distribution, is unknown. Certainly grasshoppers of all species were exceptionally rare, as they were at the time of all surveys during the 1985-86 season.]
